8. A firm hires employees at five different skill levels $P, Q, R, S, T$. The shares of employment at these skill levels of total employment in 2010 is given in the pie chart as shown. There were a total of 600 employees in 2010 and the total employment increased by $15 \%$ from 2010 to 2016. The total employment at skill levels $\mathrm{P}, \mathrm{Q}$ and R remained unchanged during this period. If the employment at skill level S increased by $40 \%$ from 2010 to 2016, how many employees were there at skill level T in 2016?

Percentage share of skills in 2010

(A) 30
(B) 72
(C) 35
(D) 60

Key: (D)

Sol:

Number of employees of skills
$\mathrm{Q}=\mathrm{R}=\mathrm{S}=25 \%$ of $600=150$
Number of employees of skill $\mathrm{P}=20 \%$ of $600=120$
Number of employees of skill T=5\% of $600=30$

## In 2016:

As there is no change in skill level of $\mathrm{P}, \mathrm{Q}$, and R
Number of employees of skill level $\mathrm{P}=120$
Number of employees of skill level $\mathrm{Q}=150$
Number of employees of skill level $\mathrm{R}=150$
Number of employees at skill level $S=40 \%$ increases $=1.4 \times 150=210$

## Q. No. 1 to 25 Carry One Mark Each

1. Consider the stress-strain curve for an ideal elastic-plastic strain hardening metal as shown in the figure. The metal was loaded in uniaxial tension starting from O. Upon loading, the stressstrain curve passes through initial yield point at $P$, and then strain hardens to point Q , where the loading was stopped. From point Q , the specimen was unloaded to point R, where the stress is zero. If the same specimen is reloaded in tension from point $R$, the value of stress at which the material yields again is $\qquad$ MPa .

$\mathrm{T}_{\mathrm{w}}=\mathrm{C}+50 \mathrm{x}$.
At $\mathrm{P}, \mathrm{T}_{\mathrm{w}}=50^{\circ} \mathrm{C}, \mathrm{x}=0.4$

At $\mathrm{Q}, \mathrm{T}_{\mathrm{w}}=80^{\circ} \mathrm{C}, \mathrm{x}=0.6$

The bottom plate is fixed and the upper plate moves to the right with a constant velocity of $3 \mathrm{~m} / \mathrm{s}$. With the assumptions of Newtonian fluid, steady, and fully developed laminar flow with zero pressure gradient in all directions, the momentum equations simplify to

If the dynamic viscosity of the lower fluid, $\mu_{2}$, is twice that of the upper fluid, $\mu_{1}$, then the velocity at the interface (round off to two decimal places) is $\qquad$ $\mathrm{m} / \mathrm{s}$.

Sol:

Given that $\frac{\mathrm{d}^{2} \mathrm{u}}{\mathrm{dy}^{2}}=0 \rightarrow(1)$
Integrating once, the above equation becomes
$\frac{\mathrm{du}}{\mathrm{dy}}=\mathrm{C}_{1} \rightarrow(2)$
Integrating equation(2),
$\mathrm{u}=\mathrm{C}_{1} \mathrm{y}+\mathrm{C}_{2} \rightarrow(3)$
From equation (3) we can say that, velocity is linearly varying so the shear stress will be constant at the interface of two viscous fluids
i.e., shear stress at $\mathrm{y}=1 \mathrm{~m}$, from fixed plate $=$ shear stress at 1 m from moving plate.
$\mu_{2}\left(\frac{\mathrm{v}_{2}-0}{1}\right)=\mu_{1}\left(\frac{\mathrm{v}-\mathrm{v}_{\mathrm{i}}}{1}\right)$
where $\mathrm{v}=$ velocity of moving plate, $\mathrm{v}_{\mathrm{i}}=$ velocity at interface of two fluids

$$
2 \mu_{1}\left(\frac{\mathrm{v}_{\mathrm{i}}}{1}\right)=\mu_{1}\left(\frac{3-\mathrm{v}_{\mathrm{i}}}{1}\right) \Rightarrow 2 \mathrm{v}_{\mathrm{i}}=3-\mathrm{v}_{\mathrm{i}} \Rightarrow \mathrm{v}_{\mathrm{i}}=1 \mathrm{~m} / \mathrm{sec}
$$

Then the velocity profile ill be as follows

[^6]54. A car having weight W is moving in the direction as shown in the figure. The centre of gravity (CG) of the car is located at height h from the ground, midway between the front and rear wheels.

The distance between the front and rear wheels is $\ell$. The acceleration of the car is a, and acceleration due to gravity is $g$. The reactions on the front wheels $\left(R_{f}\right)$ and rear wheels $\left(R_{r}\right)$ are given by
(A) $\mathrm{R}_{\mathrm{f}}=\mathrm{R}_{\mathrm{r}}=\frac{\mathrm{W}}{2}+\frac{\mathrm{W}}{\mathrm{g}}\left(\frac{\mathrm{h}}{\ell}\right) \mathrm{a}$
(B) $\quad \mathrm{R}_{\mathrm{f}}=\frac{\mathrm{W}}{2}+\frac{\mathrm{W}}{\mathrm{g}}\left(\frac{\mathrm{h}}{\ell}\right) \mathrm{a} ; \mathrm{R}_{\mathrm{r}}=\frac{\mathrm{W}}{2}-\frac{\mathrm{W}}{\mathrm{g}}\left(\frac{\mathrm{h}}{\ell}\right) \mathrm{a}$
(C) $\quad \mathrm{R}_{\mathrm{f}}=\mathrm{R}_{\mathrm{r}}=\frac{\mathrm{W}}{2}-\frac{\mathrm{W}}{\mathrm{g}}\left(\frac{\mathrm{h}}{\ell}\right) \mathrm{a}$
