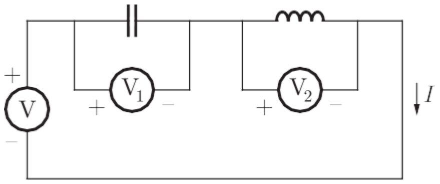
SOLUTIONS

Sol. 1 Option (B) is correct.

For an ideal voltmeter interval resistance is always zero. So we can apply the KVL along the two voltmeters as

$$V - V_1 - V_2 = 0$$

or $$V = V_1 + V_2$$



Sol. 2 Option (A) is correct.

For the +ve half cycle of I / p voltage, diode will be forward biased ($V_g = 0$, ideal diode) Therefore, the voltmeter will be short circuited and reads

$$V_1 = 0 \text{ volt} \qquad \text{(for + ve half cycle)}$$

Now, for −ve half cycle, diode will be reverse biased and treated as open circuit. So, the voltmeter reads the voltage across 100 kW. Which is given by

$$V_2 = 100 \# \frac{14.14\ 0c}{100+1}$$

So, $$V_{2,\,rms} = \frac{14}{\sqrt{2}} \text{volt}$$

Therefore, the average voltage for the whole time period is obtained as

$$V_{ave} = \frac{V_1 + V_{2,\,rms}}{2} = \frac{0 + ^14(\ 2 h}{2} = \frac{14}{2\sqrt{2}}$$

$$= 4.94 - 4.46 \text{ volt}$$

Sol. 3 Option (C) is correct.

The quality factor of the inductances are given by

$$q_1 = \frac{wL_1}{R_1}$$

and $$q_2 = \frac{wL_2}{R_2}$$

So, in series circuit, the effective quality factor is given by

$$Q = \frac{X_{Leq}}{R_{eq}} = \frac{wL_1 + wL_2}{R_1 + R_2}$$

$$= \frac{\frac{wL_1}{R_1 R_2} + \frac{wL_2}{R_1 R_2}}{\frac{1}{R_2} + \frac{1}{R_1}} = \frac{\frac{q_1}{R_2} + \frac{q_2}{R_2}}{\frac{1}{R_2} + \frac{1}{R_1}} = \frac{q_1 R_1 + q_2 R_2}{R_1 + R_2}$$

Sol. 4 Option (C) is correct.

Sol. 5 Option (A) is correct.

PMMC instrument reads average (dc) value.

$$V_{avg} = \frac{1}{T}\int_0^T v(t)\,dt = \frac{1}{20 \times 10^{-3}}\int_0^{20} v(t)\,dt$$

$$= \frac{1}{20}\left[\int_0^{10} t\,dt + \int_{10}^{12}(-5)\,dt + \int_{12}^{20} 5\,dt\right]$$

Let $\omega t = \theta$, we have instaneous voltage and current as follows.

$$v(t) = E_1 \sin\theta + E_3 \sin 3\theta$$

$$i(t) = I_1 \sin(\theta - \phi_1) + I_3 \sin(3\theta - \phi_3) + I_5 \sin(5\theta)$$

We know that wattmeter reads the average power, which is gives as

$$P = \frac{1}{2\pi}\int_0^{2\pi} v(t)\, i(t)\, d\theta \qquad ...(i)$$

We can solve this integration using following results.

(i) $\frac{1}{2\pi}\int_0^{2\pi} A\sin(\theta + \alpha)\cdot B\sin(\theta + \beta)\,d\theta = \frac{1}{2}AB\cos(\alpha - \beta)$

(ii) $\frac{1}{2\pi}\int_0^{2\pi} A\sin(\theta + \alpha)\cdot B\cos(\theta + \alpha)\,d\theta = \frac{1}{2}AB\sin(\alpha - \beta)$

(iii) $\frac{1}{2\pi}\int_0^{2\pi} A\sin(m\theta + \alpha)\cdot B\cos(n\theta + \beta)\,d\theta = 0$

(iv) $\frac{1}{2\pi}\int_0^{2\pi} A\sin(m\theta + \alpha)\cdot B\cos(n\theta + \beta)\,d\theta = 0$

Result (iii) and (iv) implies that power is transferred between same harmonics of voltages and currents. Thus integration of equation (i) gives.

$$P = \frac{1}{2}E_1 I_1 \cos\phi + \frac{1}{2}E_3 I_3 \cos\phi_3$$

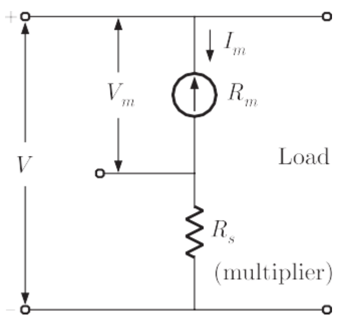
A voltmeter with a multiplier is shown in figure below.



Here I_m = Fully scale deflection current of meter.

R_m = Internal resistance of meter

R_s = Voltage across the meter

V = Full range voltage of instrument

$$V_m = I_m R_m$$

$$V = I_m (R_m + R_s)$$

$$\frac{V}{V_m} = \frac{R_m + R_s}{R_m} = 1 + \frac{R_s}{R_m}$$

Here when, $R_{s1} = 20\,\text{kW},\ V_{m1} = 440$ V

So, $$\frac{V}{440} = 1 + \frac{20\text{k}}{R_m} \qquad \text{...(i)}$$

When, $R_{s2} = 80\,\text{kW},\ V_{m2} = 352$ V

So, $$\frac{V}{352} = 1 + \frac{80\,\text{k}}{R_m} \qquad \text{...(ii)}$$

Solving equation (i) and (ii), we get

$$V = 480\ \text{V},\ R_m = 220\ \text{kW}$$

So when $R_{s3} = 40\ \text{kW},\ V_{m3} = ?$

Low values of capacitances is precisely measured by schering bridge (Q $\rightarrow$ 3)

Inductance of a coil with large time constant or high quality factor is measured by hay's bridge ($R \rightarrow$ 5)

Sol. 55 Option (C) is correct.

Full scale deflection is produced by a dc current of 1 mA

$$(I_{dc})_{fs} = 1 \text{ mA}$$

For full wave reactifier

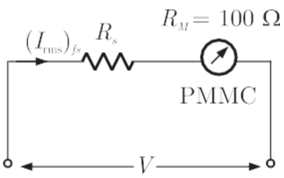
$$(I_{dc})_{fs} = \frac{2I_m}{\pi}, \quad I_m \rightarrow \text{peak value of ac current}$$

$$1 \text{ mA} = \frac{2I_m}{3.14}$$

$$I_m = 1.57 \text{ mA}$$

Full scale ac current

$$(I_{rms})_{fs} = \frac{1.57}{\sqrt{2}} = 1.11 \text{ mA}$$



$$V = (R_s + R_m)(I_{rms})_{fs}$$

$$100 = (R_s + 100)(1.11 \text{ mA})$$

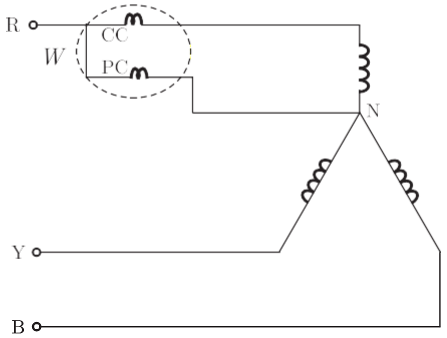
$$\frac{100}{(1.11 \text{ mA})} = R_s + 100$$

$$100 \times 900 = R_s + 100$$

$$R_s = 89.9 \text{ kW}$$

Sol. 56 Option (B) is correct.

First the current coil is connected in R-phase and pressure coil is connected between this phase and the neutral as shown below



...(1)

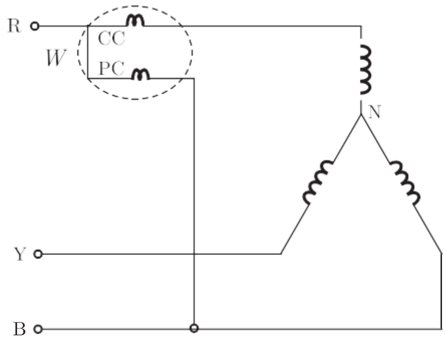
Reading of wattmeter

$$W_1 = I_P V_P \cos\theta_1, \; \cos\theta_1 = 0.8 \;\&\; \theta_1 = 36.86^\circ$$

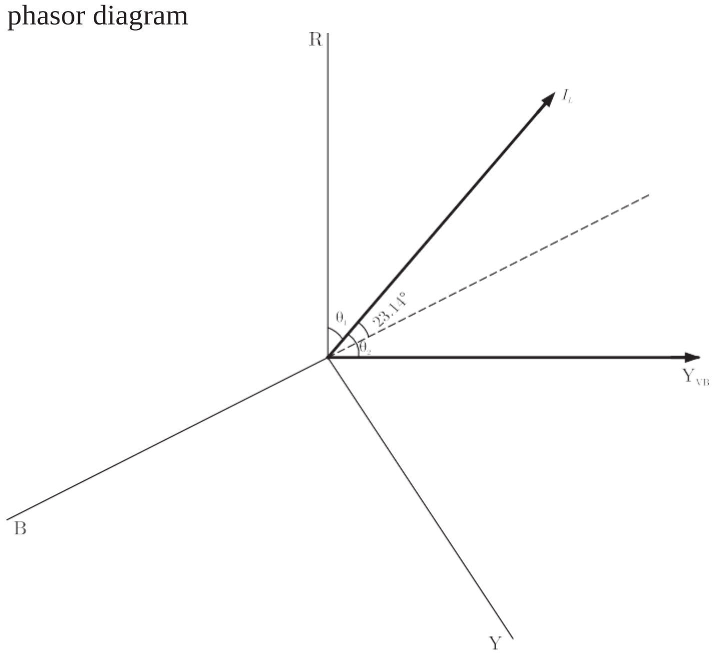
$$400 = I_L \frac{V_L}{3} \cos\theta_1$$

$$400 = \frac{I_L V_L}{3} \times 0.8$$

Now when pressure coil is connected between B and Y-phases, the circuit is



phasor diagram



angle $\theta_2 = 23.14° + 30° = 54.14°$

now wattmeter reading $W_2 = V_{YB} I_L \cos\theta_2$

from equation (1) $V_L I_L = \frac{400 \times \sqrt{3}}{0.8}$

so $W_2 = \frac{400}{0.8} \times \sqrt{3} \times \cos 53.14°$

$= 519.5$ W

Sol. 57 Option (C) is correct.

In a moving-iron ammeter control torque is given as

$$\tau_c = K\theta = \frac{1}{2} I^2 \frac{dL}{d\theta}$$

Where

$K \to$ control spring constant

$\theta \to$ deflection

$$\text{Given that } L = 10 + 3\theta - \frac{\theta^2}{4}$$

$$\frac{dL}{d\theta} = \left(3 - \frac{\theta}{2}\right) \text{ mH / rad}$$

So,

$$\tau_c = (25 \times 10^{-6})\theta = \frac{1}{2}(5)^2\left(3 - \frac{\theta}{2}\right) \times 10^{-6}$$

$$2\theta = 3 - \frac{\theta}{2}$$

$$\frac{5\theta}{2} = 3 \Rightarrow \theta = \frac{6}{5} = 1.2 \text{ rad.}$$

Sol. 58 Option (B) is correct.

$$\text{Magnetizing current } I_m = \frac{250}{1} = 250 \text{ amp}$$

$$\text{Primary current } I_p = 500 \text{ amp}$$

$$\text{Secondary current } I_s = 5 \text{ amp}$$

$$\text{Turn ratio } n = \frac{I_p}{I_s} = \frac{500}{5} = 100$$

$$\text{Total primary current } (I_T) = \sqrt{[\text{primary current } (I_p)]^2 + [\text{magnetising current } (I_m)]^2}$$

$$I_T = \sqrt{I_p^2 + I_m^2}$$

$$= \sqrt{(500)^2 + (250)^2} = 559.01 \text{ amp}$$

$$\text{Turn ratio } n' = \frac{I_T}{I_s} = \frac{559.01}{5} = 111.80$$

$$\text{Percentage ratio error } \Delta n = \frac{n - n'}{n'} \times 100$$

$$= \frac{100 - 111.80}{111.80} \times 100 = -10.55\%$$

Sol. 59 Option (C) is correct.

Power read by meter $P_m = VI \sin(\Delta - \phi)$

Where

3 '' Phase angle between supply voltage and pressure coil flux.
f '' Phase angle of load
Here

$$3 = 85c, f = 60c \quad ''a \cos f = 0.5$$

So measured power

$$P_m = 200 \# 5 \sin (85c - 60c)$$
$$= 1100 \sin 25c$$
$$= 464.88 \text{ W}$$

Actual power $\quad P_O = VI \cos f = 220 \# 5 \# 0.5 = 550$ W

Error in measurement $= P_m - P_O = 464.88 - 550 = -85.12$ W

For unity power factor cos f = 1

$$f = 0c$$

So $\quad P_m = 220 \# 5 \sin (85c - 0c) = 1095.81$ W

$\quad P_O = 220 \# 5 \cos 0c = 1100$

Error in Measurement

$$= 1095.81 - 1100 = -4.19 \text{ W}$$

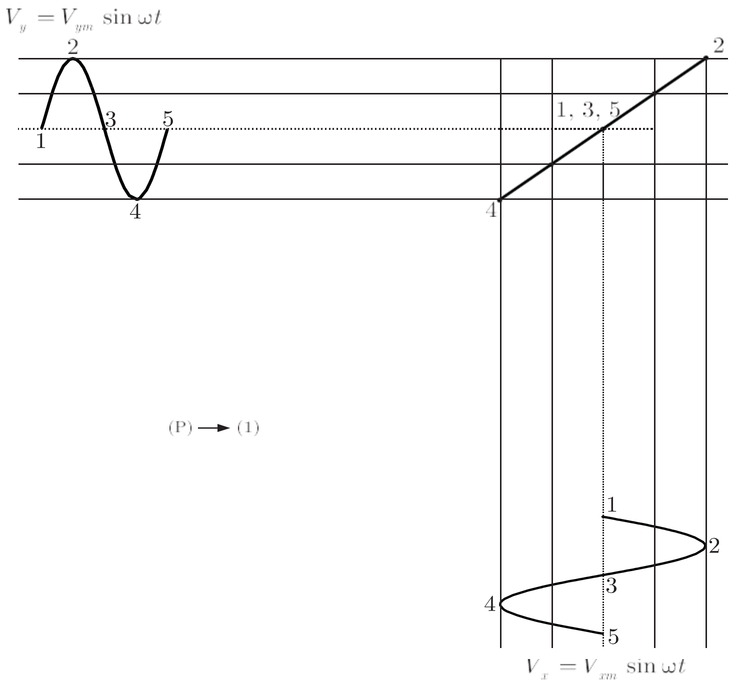
Sol. 60 Option (A) is correct.

We can obtain the Lissaju pattern (in X-Y mode) by following method.

For f = 0c, $\quad V_x = V_{xm} \sin Wt$

$\quad V_y = V_{ym} \sin (Wt + 0c) = \sin Wt$

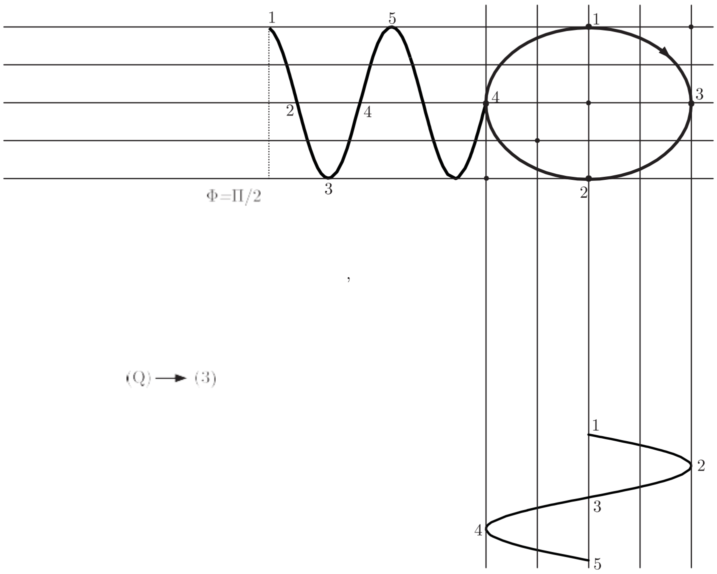
Draw V_x and V_y as shown below



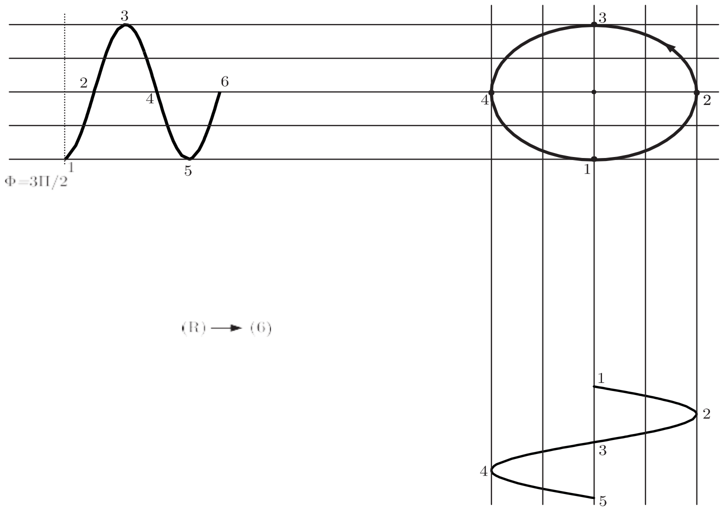
Divide both V_y and V_x equal parts and match the corresponding points on the screen.

Similarly for f = 90c

$$V_x = V_{xm} \sin Wt$$
$$V_y = V_{ym} \sin (Wt + 90c)$$



Similarly for $\phi = \frac{3\pi}{2}$



we can also obtain for $0 < \phi < \frac{3\pi}{2}$
